

PT Kahayan Agro Plantation (“KAP”), a member of the Anglo Eastern Plantation Group, has always been committed to protecting High Conservation Value (“HCV”) areas including habitat of orang utan and to respect the tribal believes of the indigenous Dayak Communities.

#### Original Dayak site.

There are two sacred tribal sites located in the middle of KAP oil palm plantation and are routinely used as a place of worship by the indigenous Dayak community.

#### Rivarian Zone

Areas that have been delineated by Consultant Aksenta as HCV Value area, especially those located along the rivarian zone, are well kept and maintained. Various trees were planted along the river bank to prevent erosion. Sign boards indicating HCV Value area were placed at several spots. In some locations, sign boards were put up to warn against hunting of protected animals and threatened species.

As a commitment to the concept of sustainable plantation development, KAP has appointed PT. Meganesia Tirta Foresta, whose team and personnel have been registered at *High Carbon Stock* (“HCS”) Network to conduct High Carbon Stock Assessment. Land clearing activities will follow based on the results and recommendation of the independent High Carbon Stock Assessment.

Meganesia Tirta Foresta conducting a HCS assessment. One of the activities undertaken was the identification of wood and plants to assess the carbon stock value in the area.

Meganesia Tirta Foresta also carried out Free Prior Informed Consent (FPIC) activities amongst the villagers and settlers as part of their procedures in assessing HCS
